
MICOS at LASER World of Photonics

MICOS this year once again presents numerous new products. Among them, we will present a new Microrobot for positioning purposes operating on the smallest space. The wide range of positioning tables will be expanded considerably: a new compact elevation stage, two very compact stages, an expansion of the PLS-85 family with travel ranges up to 150 mm, a ultraprecise linear motor driven stage for high load big rotation stage with air bearings and ultra flat moduls with linear motor, as well as new motorized micro-

meters will be added to our standard program. A new high resolving piezo controller, a USB version of the well known SM32 controller and a compact 2 axes controller for DC-, linear and stepper motors with closed loop option for highest specifications will give you the possibility to access the multifaceted applications properly. Motorized vacuum compatible units, motorized adjustable mirror mounts and a new laser education kit top the field of new developments off. A new planar module based parallelkinematic

setup will be the most interesting system which enables a fast and accurate position feedback by laser tracking. Visit us at the LASER show in Munich, Hall B1, Booth 438. We will be very happy to welcome you.
